Personas

Two personas guide the design of Sprint 2 features in AMMBER: the driver.js guided tour and model version control. These personas are fictional, but grounded in AMMBER's typical users — students learning motivational modelling, and requirements engineers or researchers building models with stakeholders.

Document purpose: Capture the target users, their goals, frustrations, and usage scenarios to inform feature design and prioritization.

Persona	Feature	Jira tickets
Mia Chen, first-time student	driver.js guided tour	AMBR-20, AMBR-21, AMBR-22
Dr. Daniel Okafor, requirements engineer	Version control	AMBR-36, AMBR-37, AMBR-38, AMBR-39, AMBR-40

Mia Chen — driver.js guided tour

> "I don't need to know everything — I just need to know what to click next."

Attribute	Detail
Age	21
Role	Third-year undergraduate in a Requirements Engineering subject
Tech comfort	Comfortable with everyday web apps; new to modelling tools and motivational models

Primary goals

- Understand the five categories: Do, Be, Feel, Concerns, and Who
- Move from an empty model to a finished diagram
- Save work successfully for submission

Key frustrations

- Does not know where to start on an empty page
- Does not want to read a long manual before using the tool

Uses AMMBER for	Building a motivational model for a class case study, submitted as a JSON file

Scenario

Mia clicks the tour button in the editor header. The guided tour walks her through the categories, adding goals, arranging the hierarchy and the rendered model, warning that **Start over** cannot be undone, and ending with saving. She reaches a first draft in about ten minutes.

How the tour helps

- Teaches the tool step by step on the real interface
- Reduces the intimidation of starting from a blank workspace
- Can be restarted at any time when Mia needs a refresher

Dr. Daniel Okafor — Version control

> "I want to experiment freely without breaking the version my client already agreed on."

Attribute	Detail
Age	38
Role	Requirements engineer and researcher running stakeholder workshops
Tech comfort	Experienced with modelling tools; uses AMMBER regularly

Primary goals

- Track how the model changes across workshops
- Mark key stages in model evolution
- Return to an earlier version quickly when needed

Key frustrations

- Relies on manual copies such as `Model_v2_final_REAL.json`

Uses AMMBER for	Building and revising models across several rounds of stakeholder workshops

- Sometimes overwrites a good version with a worse one

Scenario

Before a workshop, Daniel saves a named checkpoint, **Before workshop 2**. He restructures the hierarchy, and each Save adds an automatic checkpoint. When the client prefers the original, he restores **Before workshop 2** from Version History in one click.

How version control helps

- Provides automatic and named checkpoints
- Supports view, restore, rename, and delete actions from one list
- Keeps up to 50 versions in the browser, with named versions never dropped first

---

Design implication: Mia represents onboarding and learnability needs, while Daniel represents confidence, traceability, and safe experimentation. Together, they justify features that support both first-time use and sustained professional workflows.
